future

myclimate
industry solution

for energy suppliers

Climate- neutral natural gas

Conscientious energy suppliers are always increasing their share of biogas. With climate-neutral natural gas, you are making a significant contribution towards climate protection and sustainability.

**Do your best –
offset the rest.**

How climate friendly is natural gas?

In comparison with other fossil energy sources, natural gas is by far the most environmentally-friendly option. Nevertheless, the production of climate-damaging CO₂ is unavoidable in the production, supply and use of natural gas.

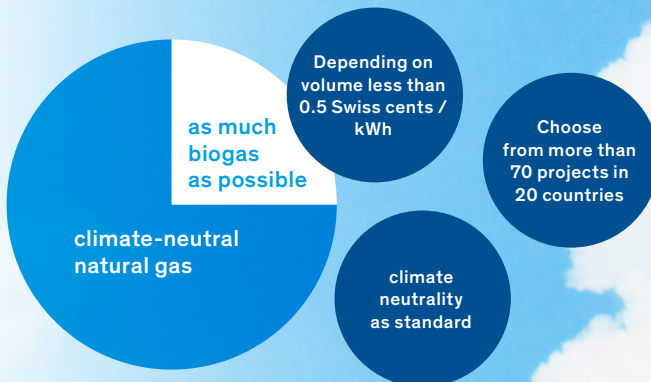

Make your natural gas more climate friendly by adding as much biogas as possible and offsetting the carbon footprint of the remaining fossil gas through high-quality myclimate carbon offset projects. This will enable you to not only protect the climate, but also promote sustainable development worldwide. You can set your product apart from the rest with the well-known myclimate climate-neutral label. With this offer, you can meet the expectations of the growing demand for climate friendly products among your end customers in the market.

How you can benefit

With climate-neutral natural gas...

- Respond to the growing customer demand for sustainable offers.
- Strengthen your customer loyalty.
- Promote the credibility of your brand.
- Obtain our recognised label to increase visibility and distinguish you from other brands.
- Create added value for your end customer with a mixture of local biogas and climate protection.
- Prepare yourself in advance for the possible liberalisation of the gas market.
- Take responsibility for securing the future for our grandchildren.

Climate-neutral natural gas with myclimate

SUSTAINABLE DEVELOPMENT GOALS

myclimate exclusively develops sustainable carbon offset projects with proven socioeconomical and ecological benefits according to UN SDG and Gold Standard criteria.

myclimate is the climate partner of the following energy supply companies:
